How to choose the right mask ?

- Understanding ASTM F2100-19/EN14683:2019 STANDARDS

Selecting the appropriate mask for a particular procedure is a critical component of your Personal Protective Equipment (PPE) protocol. Although masks may look similar, each mask has notable differences affecting the quality and level of filtration. Understanding the ASTM performance level of each face mask can help make the selection process easier and ensure your mask will provide the appropriate filtration.

Medical face mask materials covered under ASTM specifications are designated as one or more of the following performance levels based on the barrier performance properties of the materials used:

	ASTM F2100-19			EN 14683:2019 Barrier Levels		
	Level 1	Level 2	Level 3	Type I	Type II	Type IIR
BFE%	≥95	≥98		≥95	≥98	
PFE%	≥95	≥98		Not required		
Synthetic Blood	Pass at 80 mmHg	Pass at 120 mmHg	Pass at 160 mmHg	Not Required		Pass at 120 mmHg
Differential Pressure	< 5.0 mmH ₂ O/cm ²	< 6.0 mmH ₂ O/cm ²		< 40 Pa/cm ²		< 60 Pa/cm ²
Flammability	Class 1 (≥3.5 seconds)			See European Medical Directive		
Microbial Cleanliness	Not required			≤30 cfu/g		
Biocompatibility	§10K Guidance recommends testing to ISO10993			Complete an evaluation according to ISO10993		

Synthetic Blood* represents the mask's resistance to penetration by synthetic blood under pressure (mmHg). It measures the ability of a mask's material construction to minimize the saturation of fluids traveling through the material and potentially coming into contact with the wearer. The higher the fluid resistance (filtration), the better the protection.

BFE (Bacterial Filtration Efficiency) represents the percentage of aerosol particulates filtered at a size of 3 microns. It is the measure of the efficiency of the mask in filtering bacteria passing through it.

PFE (sub-micron Particulate Filtration Efficiency) represents the percentage of submicron particulates filtered at 0.1 micron. PFE is the measure of the efficiency of the mask in filtering particles passing through it. The size of the particles filtered is critical.

DELTA P (Differential Pressure) represents the pressure drop across the mask or resistance to air flow in mmH₂O/cm². This determines breathing resistance – the higher the Delta P, the less the breathability, but the better the filtration.

Flammability measures flame spread of the mask material.

How to choose the apparels correctly?

Apparels are always needed in particular occasions, they are used per procedure and per user, depending on the situation either sterile or factory clean apparels are used. After using the apparels shall be treated or disposed properly.

- Always follow the instruction of wearing proper apparels
- Make sure the apparels are suitable and correct for the environment and potential risks
- Apparels are worn or used according to right steps and take necessary preparations
- Take necessary cleaning or sanitizing before wearing
- Make sure any part of your body, which needs to be protected, get well protected
- Different apparels can be used together for further and total protection
- In all cases involving contaminating materials attention must be paid to correct taking apparels off
- After using, take necessary cleaning once again
